Parameter Table

September 9, 2014

Tim Bergsma

1 Purpose

This script picks up after model.Rnw to process bootstrap results and make a parameter table. It assumes the current working directory is the script directory containing this file.

1.1 Package

Listing 1:

```
> library(metrumrg)
```

2 inputs

'wikitab' gives us a quick synthesis of 'rlog' and the 'lookup' of wiki notation in 1005.ctl. We do some science on the result first, and then some aesthetics for printing in a LaTeXtable. Table 1.

Listing 2:

```
> tab <- wikitab(1005,'../nonmem')
> tab$estimate <- signif(as.numeric(tab$estimate),3)
> tab$tool <- NULL
> tab$run <- NULL
> tab$se <- NULL
> tab
```

```
   parameter                                 description
1     THETA1                    apparent oral clearance
2     THETA2                central volume of distribution
3     THETA3                     absorption rate constant
4     THETA4                 intercompartmental clearance
5     THETA5             peripheral volume of distribution
6     THETA6                      male effect on clearance
7     THETA7                    weight effect on clearance
8   OMEGA1.1       interindividual variability of clearance
9   OMEGA2.1    interindividual clearance-volume covariance
10  OMEGA2.2  interindividual variability of central volume
11  OMEGA3.1         interindividual clearance-Ka covariance
12  OMEGA3.2            interindividual volume-Ka covariance
13  OMEGA3.3               interindividual variability of Ka
14  SIGMA1.1                           proportional error
15  SIGMA2.2                               additive error
                                                            model estimate
1  CL/F (L/h) ~ theta_1 *  theta_6 ^MALE * (WT/70)^theta_7  * e^eta_1   9.5100
2                          V_c /F (L) ~ theta_2 * (WT/70)^1 * e^eta_2  22.8000
3                                    K_a (h^-1 ) ~ theta_3 * e^eta_3   0.0714
4                                                Q/F (L/h) ~ theta_4   3.4700
5                                               V_p /F (L) ~ theta_5 113.0000
6                                                MALE_CL/F ~ theta_6   1.0200
```

```
7                                          WT_CL/F ~ theta_7   1.1900
8                                         IIV_CL/F ~ Omega_1.1   0.2140
9                                         cov_CL,V ~ Omega_2.1   0.1210
10                                      IIV_V_c /F ~ Omega_2.2   0.0945
11                                      cov_CL,Ka  ~ Omega_3.1  -0.0116
12                                       cov_V,Ka  ~ Omega_3.2  -0.0372
13                                        IIV_K_a  ~ Omega_3.3   0.0466
14                                        err_prop ~ Sigma_1.1   0.0492
15                                         err_add ~ Sigma_2.2   0.2020
   prse
1  9.75
2  9.55
3  7.35
4  15.4
5    21
6  11.1
7  28.3
8  22.8

12  cov_V,Ka
13   IIV_K_a
14  err_prop
15   err_add
```

3 variance

The estimates for the matrix diagonals are variances, and their square roots have special meaning. In model 1005, interindividual variability was modelled exponentially, in which case square root of variance gives an approximate CV; alternatively, and exact CV can be calculated. For proportional error terms like ERR1, square root gives an exact CV. For additive error terms like ERR2, square root gives standard deviation.

We can use functions of ‘parameter’ to sort out the various error components, as they are used in this model.

3.1 exponential

Listing 4:

```
> expo <- is.iiv(tab$parameter) & is.diagonal(tab$parameter)
> tab$parameter[expo]
```

```
[1] "OMEGA1.1" "OMEGA2.2" "OMEGA3.3"
```

Listing 5:

```
> tab$cv[expo] <- cvLognormal(tab$estimate[expo])
> tab[,c('parameter','name','estimate','cv')]
```

```
  parameter      name estimate        cv

```

4 covariance

The estimates of matrix off-diagonals are covariances, and are more useful if transformed to correlations. We could extract the matrices manually, or use package shortcuts.

Listing 11:

```
> cor <- omegacor(run=1005,project='../nonmem')
> cor

           [,1]       [,2]       [,3]
[1,]  1.0000000  0.8494444 -0.1165179
[2,]  0.8494444  1.0000000 -0.5608629
[3,] -0.1165179 -0.5608629  1.0000000
```

Listing 12:

```
> half(cor)
```

```
      1.1        2.1        2.2        3.1        3.2        3.3
1.0000000  0.8494444  1.0000000 -0.1165179 -0.5608629  1.0000000
```

Listing 13:

6 aesthetics

Here we format the table for printing.

Listing 24:

```
> tab$name <- NULL
> tab$parameter <- NULL
> tab$model <- wiki2latex(tab$model)
> tab$estimate <- as.character(tab$estimate)
> tab$estimate <- paste(tab$estimate,'$', tab$units,'$')
> tab$units <- NULL
```

Note that no parameter defines more than one of CV, SD,and COR. We could collapse these into a single column, and add a descriptive flag.

Listing 25:

```
> m <- as.matrix(tab[,c('cv','sd','cor')])
> tab$variability <- suppressWarnings(apply(m,1,max,na.rm=TRUE))
> tab$variability[is.infinite(tab$variability)] <- NA
> i <- is.defined(m)
> i[!i] <- NA
> tab$statistic <- apply(i,1,function(x){
+   p <- colnames(i)[x]
+   ifelse(all(is.na(p)),NA,p[!is.na(p)])
+ })
> toPercent <- with(tab, !is.na(statistic) & statistic=='cv')
> tab$variability[toPercent] <- percent(tab$variability[toPercent])
> tab$variability <- as.character(signif(tab$variability,3))
> tab$statistic <- map(tab$statistic,from=c(NA,'cv','cor','sd'),to=c(NA,'\\%CV','
   CORR','SD'))
> tab$variability <- paste(tab$statistic,tab$variability,sep=' = ')
> tab$variability[is.na(tab$statistic)] <- NA
> tab$statistic <- NULL
> tab$cv <- NULL
> tab$sd <- NULL
> tab$cor <- NULL
```

7 simple parameter table

We can make a quick parameter table that does not use wikitab markup. Table 2.

Listing 26:

```
> tab <- rlog(1005,'../nonmem',tool='nm7',file=NULL)
> head(tab)
```

Table 1: Parameter Estimates from Population Pharmacokinetic Model Run 1005

description	model	estimate	prse	ci
